ANALYSIS OF ORGANIC CARBON STOCKS IN THE MUNICIPALITY OF ARLES

Introduction

The municipality of Arles, located in the Rhône delta, has soil characteristics influenced by its geographical position and its Mediterranean climate. According to data from the Sol Scientific Interest Group (Gis Sol), the highest organic carbon stocks in France correspond to extreme water situations, such as the marshes of the West and the Rhône delta. This suggests that the soils of Arles may have relatively high organic carbon stocks.

Conclusion

In short, we can say that this study on the analysis of organic carbon stocks in the municipality of Arles through the MLP model will allow us to see the correlation that exists between high organic carbon stocks and extreme water conditions.
